

IntelliFacet

Search and categorization suite

What is

IntelliFacet is an advanced document search, faceting, navigation and categorization engine, easy to customize for different verticals, provided with simple **REST APIs**, easy to be integrated with the application, both at the user interface tier and at the document tier.

Who is it aimed at?

B2C and B2B portal applications can benefit from IntelliFacet in order to improve the user experience and support the knowledge manager in large spectrum and specialized portals, including Web 2.0 solutions, for telco and media, e-government, e-health, e-tourism solutions, for better revenues and less costs.

B2E enterprise content management applications can benefit from IntelliFacet in order to improve the quality and efficiency in document retrieval and analysis for different verticals, as for example law, medicine, and use cases, as in marketing, research, project management, purchasing, human resource management and IP management, or in different kind of solutions, like e-learning and CRM.

Features:

- **Search:** autocompletes related terms, orders results, highlights terms in results, identifies more popular or more recent searches
- **Faceting:** provides a aggregate view/select documents before/after the search
- **Navigation:** finds similar documents, related tags
- **Categorize:** extracts relevant categories from documents
- **Tagging:** identifies related tags, extracts indexes from documents

General features

- High recall and precision achieved through semantic technology
- Easy customization on different verticals and use cases
- Easy integration into many platforms
- Scalable solution up to millions of resources
- Low response time

Search

Search functions supports the different steps of the search. In the first step IntelliFacet can autocomplete typed words or suggest related terms; in second step IntelliFacet can combine different words with different criteria (AND, OR, exact string match). When the results page is generated results can be ordered by different criteria or further selected. e.g by author or by date, suitably by the faceting function. Finally, a quick analysis of documents found is possible by providing fast access to the text passages related to the query. Besides that, IntelliFacet supports the identification of more popular or more recent queries.

Faceting

Faceting functions supports an aggregate view of documents, so the user can see how many documents are related to a time period, to an author or to a topic. Faceting functions support as well the selection of documents for a different combination of criteria, allowing for example to select documents related to author A or B in the years between 2005 and 2010. Faceting can be

activated before the search, in order to do a first view or selection of documents or after the search to refine search results.

Navigating

Navigate functions enable the user to find additional information by analogy, and this adds significant flexibility to the user interface. It is possible to navigate between documents, with the function "find similar documents", and between metadata with the function "find related tags".

Categorization

Categorization function allows to explicit "what's the document is speaking about", hence the category. This function supports also multiple categorization, if a document becomes to multiple categories, as in reviews, and null categorization, if a document does not become to predefined categories. In this last case the system administrator must evaluate if a new category is required. The categorization function is named IntelliCategory and it can be delivered also as a stand-alone package, if required by the specific application.

Tagging

Tagging can find or extract related tags of a document or a multimedia resource.
